

INSURANCE AI OPERATING MATURITY INDEX

INTERPRETATION GUIDE | P&C INSURANCE

READ THE SHAPE, NOT THE SECOND DECIMAL • Dimension score = mean of 4 answers • Weak ≤ 2.5 • Strong ≥ 3.5 • Broad strength = all five ≥ 4.0			
PROFILE	TRIGGER	WHAT THE PATTERN MEANS	ONE SPECIFIC NEXT ACTION
1 PAPER-BOUND CARRIER	All five ≤ 2.5	No link in the operating chain is digitally scalable. AI or channel investment would sit on fragmented data and manual queues.	Join policy and claims data on one governed identifier and index priority claim documents before funding AI or channel initiatives.
2 FOUNDATION GAP	Insurance Data Fabric binds	Channels, automation or AI are advancing on fragmented context. Each new use case rebuilds its own data pipeline.	Redirect the next increment of AI spend to the policy/claims identity join and extraction of FNOL forms and repair estimates.
3 EXECUTION GAP	Operating Change Capacity binds	The insurer has capability it cannot deploy at business speed. The constraint is the delivery system, not another technology purchase.	Stand up a permanent cross-functional delivery team and report decision-to-deployed cycle time as an executive metric.
4 DIGITALIZED, NOT TRANSFORMING	Channels ≥ 3.5; AI ≤ 2.5; AI among two lowest	A modern front door feeds a largely manual decision engine. Digital volume rises without changing the decision layer.	Route digital FNOL into one governed triage model embedded in the adjuster workflow, with a named human owner for triage decisions.
5 AI-NATIVE OPERATOR	All five ≥ 4.0	Capability is broad and no dimension binds. Advantage comes from compounding feedback between outcomes, models and operating rules.	Feed closed-claim outcomes into triage/underwriting models and STP exception rules on a scheduled review-and-retraining cycle.
FALLBACK WEAKEST LINK	No named profile matches	The insurer is mid-stage or uneven without one dominant gap. Progress comes from lifting the weakest link rather than spreading investment evenly.	Apply the stock action for the lowest-scoring dimension; use operating-chain priority to break exact ties.

WEAKEST-LINK STOCK ACTIONS

Insurance Data Fabric Resolve policy and claims records to a single identifier; index priority claim documents.	Policyholder & Distribution Channels Digitize the highest-volume intake journey end to end with live status and no re-keying.	Underwriting & Claims AI Put one triage or fraud model into production inside the workflow with inventory, validation and named human sign-off.	Claims & Underwriting Automation Take one high-volume, low-complexity transaction straight through and publish its STP rate monthly.	Operating Change Capacity Assign a standing cross-functional team to one priority change and report decision-to-deployed cycle time.
---	---	---	--	--

Binding gap: lowest score; ≤3.0; ≥0.75 below mean of other four; ≥0.50 below second-lowest. **Tie-break priority:** Data Fabric → Channels → AI → Automation → Change Capacity. Named profiles are evaluated in order; otherwise the weakest-link fallback applies.
